

me 35 - me 40 - k 100 evo edge banders ever more powerful

The SCM *me 35*, *me 40* and *k 100 evo* edge banders are now enriched with new devices that make them even more performing and the technological reference point for the edge banding in the joinery machines sector.

The new devices improve the machines versatility and productivity and the finish quality of the panels.

New Glue Scraping Unit

The new "glue scraping unit" with rotating copying device allows to machine without any problem even the most delicate panels.

Reliability, ease-of-use and dimensions are unchanged compared to the previous model.

New Edge Scraping Unit

The new "edge scraping unit", implemented with a numerical indicator for the horizontal adjustment, enables a quick positioning of the unit during the processing of edges with different thicknesses.

New Nesting Copying Devices

The nesting copying devices, for the trimming unit and the edge scraping unit, allow to machine without any problem panels coming from "nesting" production cycle (with seats for hinges executed before the edge banding phase).

Can be ordered with the machine or a later time.

Glue pot for PUR glue with rapid purging system

It is ideal to work with polyurethane glue or when using glues of different colors. The new rapid purging system highly increases the machine productivity, reducing downtimes for cleaning and glue replacement operations.

IR Lamp

Ideal for those who work in cold environments, it considerably optimizes the gluing quality by heating the panel before the glue application.

Lighting of the machine interior

The high efficiency LED lamp improves the view of the operating units inside the machine without needing to open its door. This device is particularly useful for a safe observation of the machine during the processing.
